

Witech France SAS: Waste to Energy technology supplier in Western Europe

After many years spent in business development in fields as diverse as advertising or the movie industry, I have decided to dedicate myself to green technology, more precisely to develop sustainable solutions related to waste. With the creation of Witech France, together with my long time friend and partner Kevin Gesseau, we intend to adapt the Waste to Energy and Water treatment solutions already developed in Africa in France and its West Indies. This same strategy has also led to the creation in the Balkans of Witech Black Sea, since Waste to Energy and Water treatment are the two sides of the same coin to contribute to make the planet a more sustainable place to live, wherever these solutions might be applied.

At Witech Group, we really believe that business opportunities and environmental awareness are finally complementary. After a thorough reflection upon ourselves on how to make a difference in the business of environment, we have chosen to work with people who have adopted an innovative approach to bring totally new solutions to environmental issues.

Hence a first agency agreement with WOIMA, the inventor of the first modular waste to energy plant in the world. Flexible, and adjustable, this new plant introduce a total change in the waste to energy market, where it's not anymore the waste that goes to the plant, but the plant that goes to the waste. This new approach substantially reduce CO2 costs by multiplying opportunities to close local waste landfills, and limiting waste transportation. And these adaptable solutions apply everywhere, with MSW in Africa, or with RDF in France or Bulgaria.

The modular adjustable approach also allows us to be as close as possible to our clients, the energy off-takers, whether they need steam heat, cold or industrial steam.

Modularity is now becoming a trademark of Witech Group, the same logic is spreading to the Water Filtration market. With ACON, Witech France discovered that water filtration issues are not only African issues, but finds its owns application for instance in Corsica, or in the French West indies.

The need for a more decentralized approach of Waste Management and Water treatment is confirmed every day, as a global awakening to the protection of the environment.

Truly, nothing is more stimulating for an entrepreneur when its business merges with a vital mission for a cleaner and more sustainable planet.

This is how Witech Group was born, and how it will live on and prosper.
